

RETINAL IMAGING

In order to provide you with the most thorough comprehensive eye exam possible:

Metro Eye's doctors advise all patients to have Ultra-Wide Retinal Imaging performed.

In conjunction with your eye exam procedure, a technician will photograph your retina using a non-invasive diagnostic tool called the CLARUS 500 Ultra-Wide Fundus Camera. An Ultra-Wide Retinal Image allows for a 200-degree stationary view of your retina, which in the past could only be examined after a patient's pupils were dilated. Although Ultra-Wide photos are not a replacement for dilation, this technology helps to decrease the frequency and the reasons for which dilation is required. If your doctor decides that you need to be dilated in addition to these photos, she will discuss that with you during your exam.

Ultra-Wide Retinal Imaging is not covered by your insurance and can be performed at an additional charge of \$39.

You will be asked to accept and authorize that Ultra-Wide Retinal Imaging will be included with your eye exam in order for the Metro Eye team to provide a comprehensive health eye exam.
